Contents

PART I - CREATE THE DTM

1) Import and clean dataset

```
# import the data
tw <-  read_csv("data/large_files/politicians_all_final_tweets.csv")
```

```
## Rows: 396611 Columns: 10
## -- Column specification --------------------------------------------------------
## Delimiter: ","
## chr (9): tw_screen_name, nome, tweet_testo, creato_il, url, party_id, genere...
## dbl (1): creato_il_code
##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```
# Adjust datetime (Run code in this order!)
Sys.setlocale("LC_TIME", "C")
tw$date <- as.Date(strptime(tw$creato_il,"%a %b %d %H:%M:%S %z %Y", tz = "CET"))
tw$date <- na.replace(tw$date, as.Date(tw$creato_il))

# Create week variable
tw <- tw %>% mutate(week = cut.Date(date, breaks = "1 week", labels = FALSE))

# Create month variable
tw <- tw %>% mutate(month = cut.Date(date, breaks = "1 month", labels = FALSE))

# Remove missing from tweets column (using remove_na tidyverse)
tw <- tw %>% drop_na(tweet_testo)
```

```
# Remove space from genere variable
a <- unique(tw$genere)
tw$genere <- gsub(a[3],"male",tw$genere)

# Select variables for the analysis
dataset <- tw %>% select(nome, tweet_testo, genere, party_id,chamber,status, date, week, month )
```

2) Create the corpus

```
corp <- corpus(dataset, text = "tweet_testo")
```

3) Create the Dfm removing stopwords and trimming

```
my_word <- as.list(read_csv("data/it_stopwords_new_list.csv", show_col_types = FALSE)) #read.csv with u

my_list <- c(" ","c'è","+"," ", my_word$stopwords, stopwords('italian'))

rev_dfm <- dfm(corp, remove =c(stopwords("italian"), my_list),
               tolower = TRUE, stem = FALSE, remove_punct = TRUE, remove_numbers=TRUE)
```

```
## Warning: 'dfm.corpus()' is deprecated. Use 'tokens()' first.

## Warning: '...' should not be used for tokens() arguments; use 'tokens()' first.

## Warning: 'remove' is deprecated; use dfm_remove() instead

## Warning: 'stem' is deprecated; use dfm_wordstem() instead
```

```
rev_dfm <-   dfm_trim(rev_dfm, min_termfreq = 0.95, termfreq_type = "quantile",
                      max_docfreq = 0.1, docfreq_type = "prop")
rev_dfm <- dfm_group(rev_dfm, groups= month)

kable(topfeatures(rev_dfm, 20), col.names = "TopFeatures")
```

	TopFeatures
governo	25991
grazi	20761
lavoro	18274
paes	16444
anni	16281
<U+0001F1EE><U+0001F1F9>	15196

4) Convert the Document Feature Matrix (Dfm) in a Topic Model (Dtm)

```
dtm <- quanteda::convert(rev_dfm, to = "topicmodels")
```

PART II - FIND THE BEST NUMBER OF TOPICS K

1) First try K = 20:80

```
load("data/results1.Rda")
```

```
## Finding the best K
top1 <- c(20:80)

## let's create an empty data frame
results1 <- data.frame(first=vector(), second=vector(), third=vector())

system.time(
  for (i  in top1)
  {
    set.seed(123)
    lda1 <- LDA(dtm, method= "Gibbs", k = (i),  control=list(verbose=50L, iter=100))
    topic <- (i)
    coherence <- mean(topic_coherence(lda1, dtm))
    exclusivity <- mean(topic_exclusivity(lda1))
    results1 <- rbind(results1 , cbind(topic, coherence, exclusivity ))
  }
```

```
)
# save(results1,file="data/results1.Rda")
```

```
kable(head(results1))
```

topic	coherence	exclusivity
20	0.1674464	9.352493
21	0.8376643	9.386225
22	0.7783789	9.396400
23	0.3991629	9.420433
24	0.2202299	9.457425
25	-3.0470840	9.470567

```
kable(tail(results1))
```

	topic	coherence	exclusivity
59	78	-3.9815896	9.821740

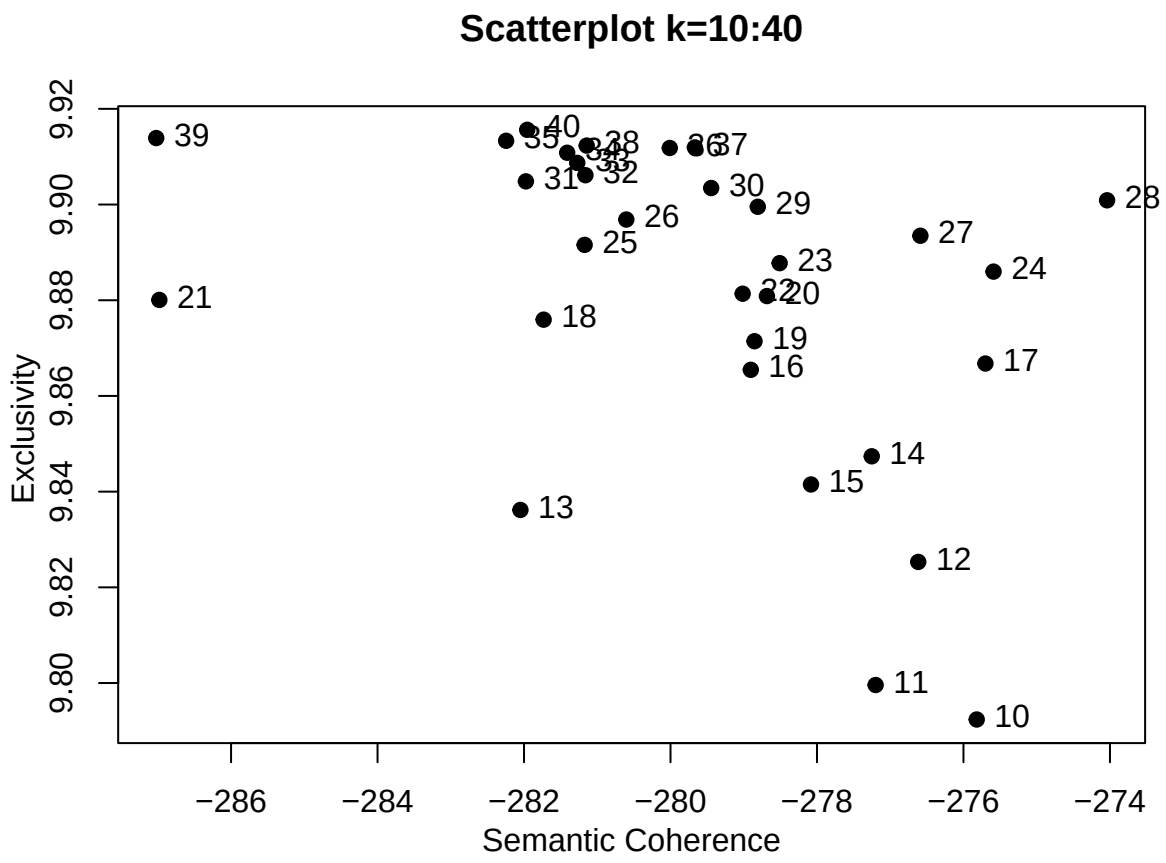
39	-287.0217	9.913895
40	-281.9565	9.915620

```
str(results1)
```

```
## 'data.frame':    31 obs. of  3 variables:
##  $ topic      : num  10 11 12 13 14 15 16 17 18 19 ...
##  $ coherence  : num  -276 -277 -277 -282 -277 ...
##  $ exclusivity: num  9.79 9.8 9.83 9.84 9.85 ...
```

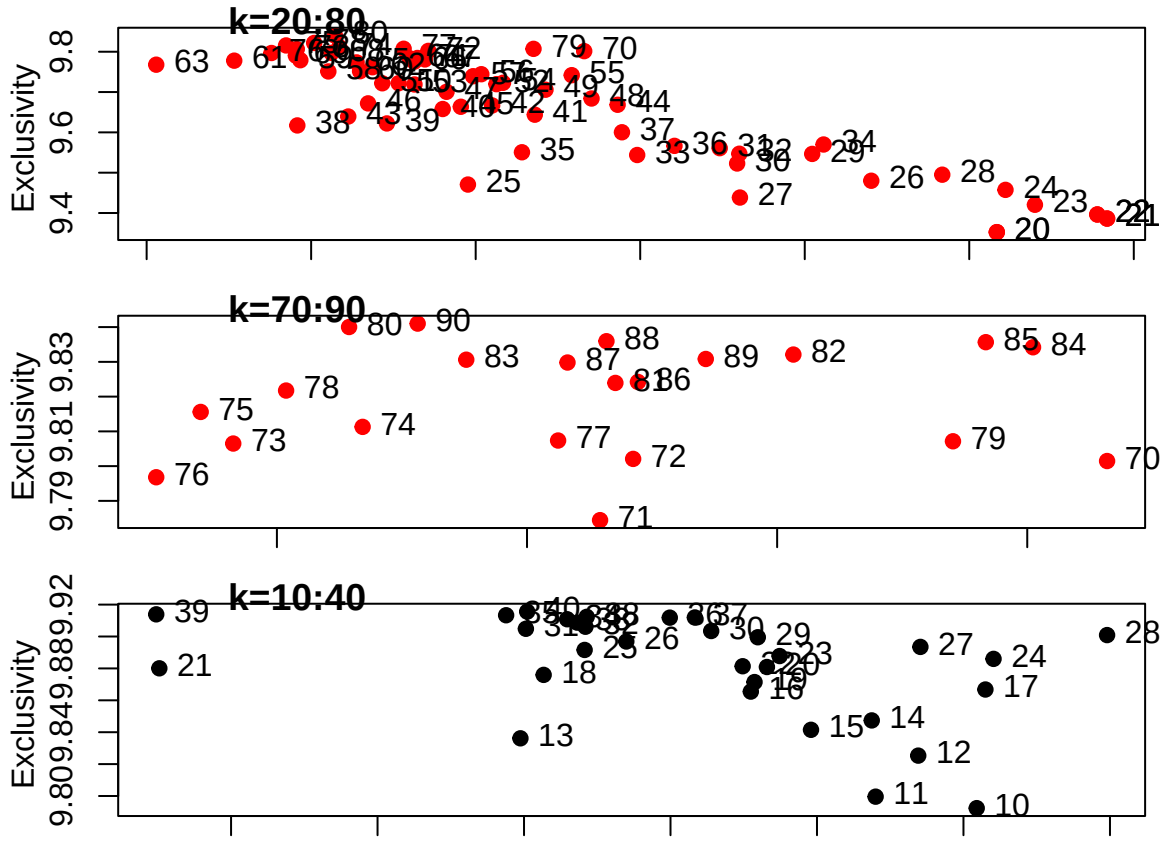
```
## k= 10-40
plot3 <- as.ggplot(~plot(results1$coherence, results1$exclusivity, main="Scatterplot k=10:40",
     xlab="Semantic Coherence", ylab="Exclusivity ", pch=19,
     col=ifelse(results1$coherence<=-153.9 | results1$exclusivity<9.9610 ,"black","red")) +
       text(results1$coherence,
            results1$exclusivity, labels=results1$topic, cex= 1,  pos=4))
plot3
```



```
#ggsave("figs/plot_k_10-40.png", plot = plot3)

grid <- plot_grid(plot1, plot2, plot3,
                  labels = list("k=20:80", "k=70:90", "k=10:40"), label_x = .15, nrow = 3)

# ggsave("figs/plot_grid.png", plot = grid)
grid
```



After this try i can state that 30(81) is the best choice

PART III - ANALISYS OF THE TOPICS

```
load("data/lda_k_30.Rda")
```

```
system.time(lda <- LDA(dtm, method= "Gibbs", k = 30, control = list(seed = 123)))
# save(lda, file = "data/lda_k_30.Rda")
```

Here i extract the most important terms from the model

```
terms <- get_terms(lda, 10)
dt1 <- terms[,1:10]
dt2 <- terms[,11:20]
dt3 <- terms[,21:30]

This method turns out to be cumbersome and not very informative because for many "topics" it is difficult for me to find a label.

So, I also decided to repeat the search using a much lower K trying to interpret the topics as a films genere.

PART IV - RE-ANALISYS OF THE TOPICS as GENRE

	Topic 21	Topic 22	Topic 23	Topic 24	Topic 25	Topic 26	Topic 27	Topic 28	Topic 29	Topic 30
titles	21	22	23	24	25	26	27	28	29	30
